

DK-2 Multiple Spectral Plotting

by

R. M. Hoffer and F. E. Goodrick

I. Data Collection

During the summer of 1966, a DK-2 spectrophotometer having data-digitizing capability<sup>1/</sup> was utilized to collect spectra from numerous plant and soil samples, primarily in the 0.5 - 2.6  $\mu\text{m}$  portion of the spectrum. The digitization feature of this instrument (a Datex encoder) allowed reflectance values to be recorded on computer punch cards at 10  $\mu\text{m}$  wavelength intervals. A limited number of spectra from various plant and soil samples have been collected since 1966, but since the instrument used did not have a digitization feature, the reflectance at only a few wavelengths has been digitized.

Most plant samples were obtained from field grown, rather than greenhouse grown materials, and represent many stages of maturity as well as many species, varieties, portions of the plant, and parts of the leaves. It is believed that all of the above factors affect spectral response. For most of the leaf samples, moisture content was also obtained using the formula:

$$\text{M.C. (in\%)} = \frac{\text{Fresh Leaf Weight} - \text{Dry Leaf Weight}}{\text{Fresh Leaf Weight}} \times 100$$

For about 10% of the samples, microscope slides were prepared of the leaf cross sections. Table 1 shows the number of spectra obtained for the various species and varieties, by date period.

---

<sup>1/</sup> Mr. Charles Olson, School of Natural Resources, University of Michigan, is acknowledged for the loan of this instrument system, which is owned by the Office of Naval Research.

Soil spectra representing various soil types, moisture content, and condition of ped were also obtained. Since the soil samples had to be inserted in "sample holders" for the measurement, spectra of natural field conditions (such as crusted soil surfaces) could not be obtained. Table 2 shows the number of soil spectra obtained for the various soil types and conditions of soil samples.

These spectra, along with the necessary calibration data and the leaf cross sections, comprise the LARS DK-2 data collection. To facilitate the analysis of these data, they have been normalized to a full range of 0 to 100% reflectance, through the use of the calibration curves, and the normalized spectra are recorded on a data storage tape (Tape No. 50 in the LARS Tape Files). Header card information has been recorded in a coded format for each spectral curve. Printouts of this header code information are shown in Appendix A.

## II. DK-2 Plot Program

A computer program, named "DK2PLT" has been designed to (1) read DK-2 data from the data storage tape, (2) sort the data into a maximum of 6 groups, according to sorting conditions specified by the user, (3) average the reflectance at each recorded wavelength interval, and (4) plot, on a single set of coordinates, a graph of the averaged spectral reflectance values for all groups, as well as frequency histograms of the moisture content data for each group. Figures 1-4 show examples of these computer printouts.

The types of parameters on which a researcher can sort include species, variety, plant part, leaf part, date, moisture content, type of measurement (reflectance or transmittance, from top or bottom of leaf), and if desired,

pigment or soil series name and field designation.<sup>2/</sup> After establishing the experiment and deciding on the various sorting criteria, it is recommended that a DK-2 Plotter Program Data Card sheet (Fig. 5) be filled out, using the format shown below. Following this, the computer cards can be punched, and the program run on the LARS 360/67 computer.

---

<sup>2/</sup> The sorting operation is designed such that all sorting conditions must be satisfied before a spectrum is accepted (i.e. condition 1 and condition 2, and.....condition n.) This system is usually sufficient for most researchers. However, it is possible to add more complex sorting operations to the program, through the use of separate subroutines which are specific for the individual researcher's requirements.

Card No. 1 (see Fig. 5)

- Col. 2 Number of sorting groups. Maximum = 6; recommended that you use 4 or less, so that spectra are not on top of each other.
- Col. 4 Wavelength interval on plot abscissa. Use 2, (unless you desire an elongated printout, in which case use 1).
- Col. 6 Request for listing of header card information for selected data. Use 0 (zero) or leave blank. (To suppress this listing, use 1. However, this is not recommended.)
- Col. 7-11 Symbols designated for each group. One character per group, adjacent columns (Col. 7 = Group 1, Col. 8 = Group 2, etc.). Any character on keypunch may be used.
- Col. 13-80 Comment regarding identification of materials selected for comparison (optional).

Card No. 2

- Col. 2 Number of sorting conditions (usually less than 5). (This number should be the same as the number of cards for the sorting criteria for each group, which must be the same for each group.)
- Col. 3-10 Highest serial number of interest. Punch decimal. Default = all spectra.
- Col. 11-20 Data tape number. Punch Decimal. Default = Tape 50.

Card No. 3

- Col. 1-80 Title card for Group 1.

Card No. 4 +

- Col. 1-10 Sorting criteria (see below)
- Col. 11-20 Relational operator (see below)
- Col. 21-30 Specific sorting parameters (see below)

Card No. N

- Col. 1-80 Title card for Group 2.

Card No. N +

- Col 1-10, Col. 11-20, Col. 21-30 - Sorting criteria, relational operator, and specific sorting parameter sequence for Group 2.

(Continue this sequence for remaining sorting groups, as shown on sheet in Fig. 5.)

III. Sorting code information

Columns 1-10 (must use decimal)

| <u>Number<br/>Code</u> | <u>Sorting Criteria</u>   |
|------------------------|---|
| 1.                     | Serial number   |
| 2.                     | Plant Species, or material (eg. soil)   |
| 3.                     | Plant Variety, or Soil Texture, or Misc. Expt.                                      |
| 4.                     | Portion of plant or soil description (Ped)  |
| 5.                     | Section of leaf or soil treatment (moisture)  |
| 6.                     | Year  |
| 7.                     | Month   |
| 8.                     | Day   |
| 9.                     | Moisture content x 10   |
| 10.                    | Pigment and material or soil series name  |
| 11.                    | Field number  |
| 12.                    | Type of measurement (reflectance, transmittance, top of leaf, bottom of leaf, etc.) |

Columns 11-20 (must use decimal)

| <u>Number<br/>Code</u> | <u>Relational Operator</u>   |
|------------------------|------------------------------|
| 1.                     | < (less than)                |
| 2.                     | ≤ (less than or equal to)    |
| 3.                     | = (equal to)                 |
| 4.                     | ≠ (not equal to)             |
| 5.                     | ≥ (greater than or equal to) |
| 6.                     | > (greater than)             |

Columns 21-30 (must use decimal)

Specific sorting parameters (only those used are shown)

Field Number Explanation & former field numbers (11.0)

First Digit - Geographic Area

- 1. Greenhouse
- 2. Agronomy Farm
- 3. Sand Farm
- 4. Forest or Orchard
- . Miscellaneous
- 9. Unknown

Second and Third Digits - Field Number (numerical portion)

\*Fourth Digit - Irrigation Treatment or Direction

- 1. Irrigated
- 2. Non-Irrigated
- 3. North
- 4. East
- 5. South
- 6. West
- 7. Unknown

\*Except Agronomy Farm Field 31, fourth digit refers to A2=1, A3=2, B1=3, B2=4, B3=5, C1=6, C2=7, C4=8, C=3.

| <u>Number<br/>Code</u> | <u>Type of measurement</u> (12.0)  |
|------------------------|--|
| 0.                     | Total reflectance from top (ventral) side of leaf (5° angle)                       |
| 1.                     | Total reflectance from bottom (dorsal) side of leaf (5° angle)                     |
| 2.                     | Transmittance, radiation entering from top side of leaf (5° angle)                 |
| 3.                     | Transmittance, radiation entering from bottom side of leaf (5° angle)              |
| 4.                     | Total reflectance of soil or rock sample, or from top side of leaf (perpendicular) |

#### IV. Examples

Figure 5 shows the DK-2 Plotter Program Data Sheet filled out for a sorting sequence to compare green soybeans, air dried clay and air dried sandy loam soils. The prepared data deck is shown in Figure 6. This deck was used to obtain Figures 1 and 2.

A DK-2 Plotter Program Data Card Sheet prepared to allow a comparison of averaged spectra for 4 moisture content groups of corn leaves is shown in Figure 7. The data deck is shown in Figure 8. The results obtained were shown in Figures 3 and 4.
